David Adams

Business Operations, Data Systems and Cloud

Pasadena, CA | davidwhittemoreadams@outlook.com | davidadams.io | LinkedIn | GitHub

Professional Summary

Data science graduate student with a business background who designed, built and maintains the internal operations platform a media-storage business uses alongside QuickBooks. Owns systems end to end, from the database and AWS hosting to the people who use them.

Education

University of Colorado Boulder | MS in Data Science, in progress (online) — Expected 2027 | GPA 3.7
Coursework: probability and statistical inference, algorithms, relational databases and SQL, data visualization

University of Idaho | BS in Business, Marketing — December 2021

Skills

Data: SQL (PostgreSQL, query tuning), Python (pandas, scikit-learn), R, database design, statistics, backtesting
Cloud and systems: AWS (EC2, IAM, Systems Manager), Docker, Linux, FastAPI, Next.js, Cloudflare (Tunnel, R2), Tailscale
Integrations: data pipelines, REST APIs (eBay, Apollo, distributor APIs, Google Maps Routes), Windows UI automation
Business: QuickBooks Desktop, Excel and Office, inventory, purchasing, vendor pricing and fulfillment workflows
AI tools: Claude Code and Codex for development; language-model pipelines with fact-checked, rule-bound output

Professional Experience

Inventory & Logistics Coordinator — Sep 2025 – Present
IVB Media Services | North Hollywood, CA

- Designed, built and maintain the company's internal operations platform (FastAPI, PostgreSQL, Next.js on Docker): inventory, orders, serial-number receiving, returns, roles and reporting across operations, sales and purchasing sites.
- Moved the live platform to AWS the same day an internet outage took the on-site server offline: restored the database from an offsite backup, exposed it only through an outbound tunnel (no open ports), recovered the outage-window records by database comparison, and kept the on-site NAS as a backup.
- Built read-only data pipelines from QuickBooks Desktop that bring new orders in within about 5 minutes and close purchase orders once QuickBooks marks them received.
- Automated QuickBooks pick-pack steps that have no API through Windows UI automation, and eBay fulfillment: tracking posts back to eBay, a delivery signature is recorded and the office gets an "OK to invoice" email.
- Built purchasing tools that compare distributor and marketplace prices by part number, pull PO tracking from distributor APIs and flag late orders.
- Run shipping and receiving; built a ranked daily work list and a delivery route builder (Google Maps Routes).
- Cut a slow import query from 394 ms to 5 ms by profiling the database; merged 48 duplicate SKUs into 39 categories.
- Built a sales lead engine that finds decision-makers via the Apollo API on a credit budget, researches each company, and checks every draft against send-safety rules before it can go out.

Projects

Prediction-market research and trading system — 2026

- Built an automated research and trading system for Kalshi prediction markets: scheduled data collection, weekly model retraining and hard risk limits (drawdown-based size cuts and a daily stop).
- Test ideas on held-out data with rules fixed in advance (one study: 103 variants, none passed); a strategy that did pass trades live at small size under staged limits.

E-commerce ETL pipeline and data warehouse — github.com/daviddaadams

- Python pipeline that validates order, customer, product and inventory files on six data-quality dimensions and loads a star-schema warehouse (daily sales facts, SCD Type 2 customer history) for sales reporting by product, category and segment.

Earlier Experience

Marketing Associate, Rosewood Revitalization Group: email campaigns and community outreach — 2021
Marketing Team Member, Palouse Properties: website redesign and a rental-season marketing plan — 2020
Sports Journalist, Page6Sports: ran the college football section; feature carried by Bleacher Report — 2016–2018
